Gobius Pro sensors, Security, Emergency and Rescue

Security is important in most situations. But in some situations it may be good to have the sensor available to several people. An example is when a person does the installation and the sensor should be available for more than one person). In our new App, version 3.0 we have added new and better security features.

Open or Closed

At installation, you can choose whether the sensor should be Open to everyone, or Closed and only accessible to your phone, i.e. the phone you are installing your sensor with.

Open = anyone can access your sensor re-install the sensor.
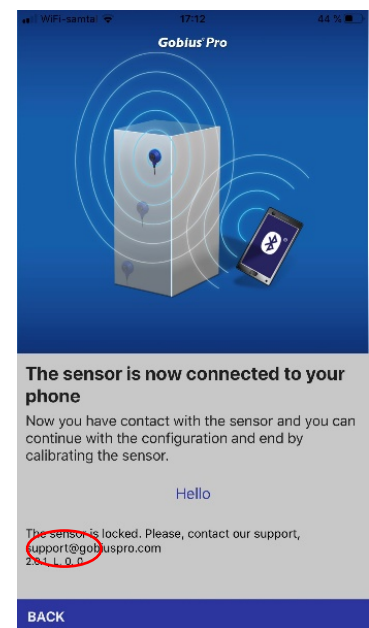

Closed = only the phone from which installation is made can view the fluid level, change settings and remove the sensor from the App. This is the most secure option.

Emergency

If you have selected Closed and need to reinstall the App on your phone, you need to unlock the sensor and make it available again.

Do like this

- First connect yellow and green cable with each other and power up the sensor
- Launch your App and run the Guide.
- When you come to this page
- Tab 7 times on the text to the left "The sensor is locked…" on your phone, your sensor will open again, and you can continue with your installation
- Don't forget to disconnect the green and yellow cable again

Another good feature, Copy

Whether the sensor is Open or Closed, you can always copy the sensor settings to another phone, so that it also can see and use the sensor. But the phones have to have the same operating system (iOS or Android). Then open your App and go to Edit and select Copy Tank settings, and click on the text. Now you can choose how you want to send the settings, Mail, Messages, WhatsApp, etc.
